

\$402 Protocol Specification

Tokenized Attention Economy with
Social Scaling

Version: 3.0.0

Status: Living Document

Reference Implementation: [PATH402.com](https://path402.com)
(<https://path402.com>)

Overview

\$402 is a protocol for tokenized attention markets. Every participant mints their own token, creating a market for their time and content. The network scales socially through genuine relationships, not viral mechanics.

The Progression:

1. **Content Tokenization** (v1-v2): Turn URL paths into shareholder businesses
2. **Personal Tokenization** (v3): Turn individuals into attention markets

Core Principles

1. **Everyone has a token** - Your token is your attention market
 2. **Fixed supply** - 1 billion tokens per person (no minting/burning)
 3. **Time-based access** - Tokens purchase connection time (1 token = 1 second default)
 4. **Creator-controlled float** - You decide how many tokens to sell
 5. **Social bootstrapping** - Friends invest in friends
-

Token Economics

Supply Model

Per-person supply: 1,000,000,000 tokens (1 billion)

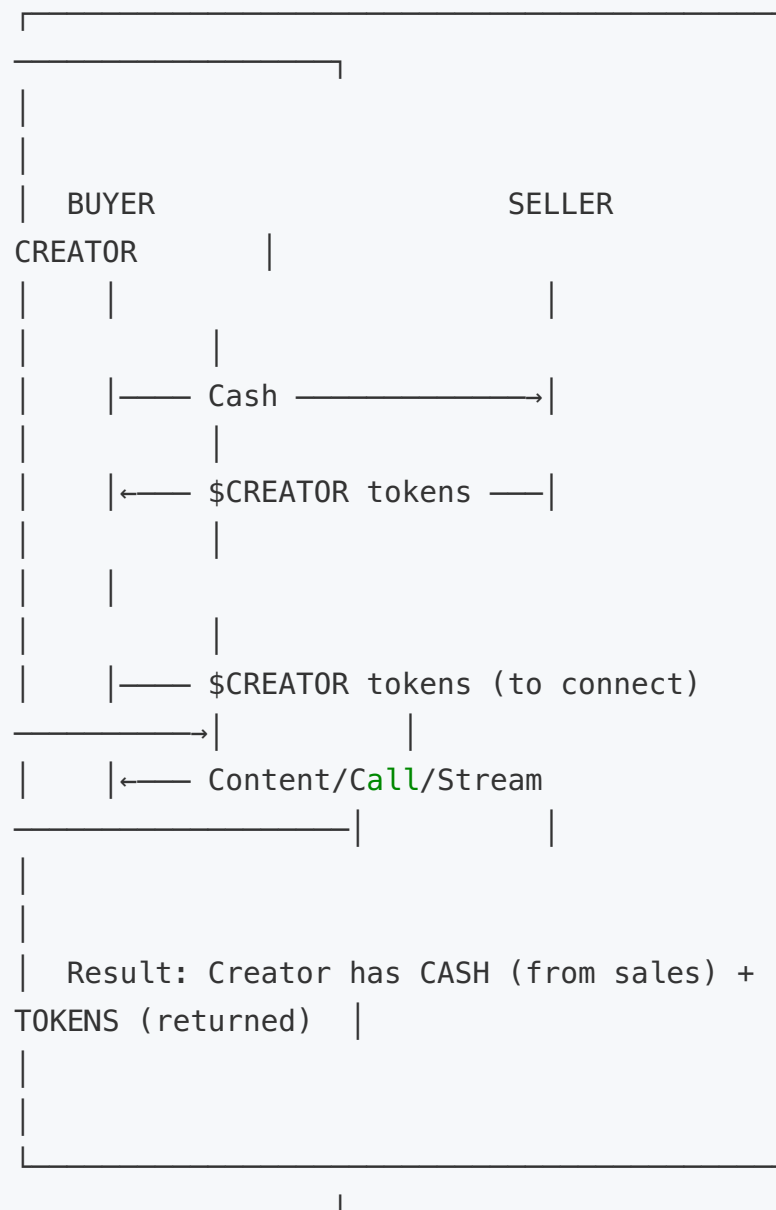

No minting after genesis

No burning – tokens circulate

Access Pricing

Base rate: 1 token = 1 second of connection
Configurable per creator: 1-100
tokens/second
Multicast: Same rate, split across viewers
(or flat per viewer)

The Economic Flow

Creator Float Control

Strategy	Token Float	Price	Result
Exclusive	Low (hold most tokens)	High	Premium access, fewer connections
Accessible	High (sell freely)	Low	Mass audience, lower per-connection value
Balanced	Medium	Market-driven	Organic price discovery

Social Scaling

The Friend Investment Model

Users naturally invest in people they care about:

I value my friend

↓

I buy MORE tokens than I need

↓

I stake tokens (earn from their success)

↓

I complete KYC (because I trust them)

↓

They succeed → I profit + maintain access

↓

Network grows through real relationships

Why This Works

1. **Aligned incentives** - Supporting friends = potential profit
2. **Natural liquidity** - Social circles create baseline markets
3. **Trust bootstrapping** - KYC happens where trust exists
4. **Anti-spam** - Connecting costs tokens (economic friction)
5. **No platform rent** - Direct peer-to-peer settlement

Staking & Dividends

Staking Mechanism

Stake \$CREATOR tokens

↓

Receive share of creator's revenue

↓

Revenue = all token purchases for their content

↓

Dividend = $(\text{your_stake} / \text{total_staked}) \times \text{revenue} \times \text{dividend_rate}$

Dividend Claims & KYC

- **Basic access:** No KYC required (permissionless)
- **Dividend claims:** KYC required
- **Identity anchor:** Phone contract, government ID, or trusted verifier
- **Result:** Voluntary identity layer where money flows out

Revenue Split (Default)

Creator revenue from token sales:

└─ 70% → Creator wallet

└─ 20% → Staker dividend pool

└─ 10% → Protocol treasury (\$402 token holders)

Connection Types

1. Direct Call (1:1)

Caller spends: N tokens (for N seconds)
Creator receives: N tokens
Bidirectional: Both parties spend each other's tokens
Net cost: Difference in token values

2. Multicast Stream (1:Many)

Creator streams content
Each viewer spends: N tokens/second
Creator receives: $N \times \text{viewers}$ tokens
Scales to unlimited viewers

3. Asymmetric Value Calls

$\$RICHARD$ worth: 1000 sats/token
 $\$BOB$ worth: 100 sats/token

Bob calls Richard:

- Bob spends $\$RICHARD$ tokens (expensive)
- Richard spends $\$BOB$ tokens (cheap)
- Net: Bob pays ~900 sats/second to talk to Richard

Richard calls Bob:

- Same mechanics, reversed
- Net: Richard earns ~900 sats/second

Client Features

1. Identity & Minting

YOUR TOKEN: \$YOURNAME
Supply: 1,000,000,000
Float: 100,000,000 (10% for sale)
Floor price: 500 sats
Access rate: 1 token/second

2. Discovery & Indexing

DISCOVER

Search tokens...

TRENDING	FRIENDS	NEW
└ \$SPIELBERG	\$ALICE	\$JANE
└ \$ROGAN	\$BOB	\$MARK
└ \$MRBEAST	\$CAROL	\$SARA

3. Portfolio & Rankings

MY PORTFOLIO

Token	Balance	Value	Staked
\$ALICE	50,000	\$25.00	Yes
\$BOB	10,000	\$5.00	No
\$CAROL	100,000	\$75.00	Yes
Total: \$105.00		Dividends: \$12.50	

4. Video/Audio Calls

VIDEO FEED

Calling: \$ALICE

Rate: 1 token/sec (500 sats/sec)

Balance: 50,000 tokens (13.8 hours)

[Mute] [Video] [End Call]

5. Staking Panel

STAKING

\$ALICE – Staked: 25,000 tokens

└ Your share: 2.5%

└ Total pool: 1,000,000 staked

└ This month: \$50.00 revenue

└ Your dividend: \$1.25

[Stake More] [Unstake] [Claim]

6. KYC Tab

IDENTITY VERIFICATION

Status: ✓ Verified

Method: Phone contract

Verified: 2026-02-01

Linked tokens (can claim dividends):

└ \$ALICE ✓

└ \$BOB ✓

└ \$CAROL ✓

[Add Verification] [Manage]

Protocol Messages

Token Operations

```
interface TokenTransfer {
  token_id: string;      // e.g., "$RICHARD"
  from: string;          // sender address
  to: string;            // recipient
  address
  amount: number;        // tokens
  transferred
  purpose: 'purchase' | 'access' | 'stake' |
  'unstake' | 'dividend';
}
```

Connection Handshake

```
interface ConnectionRequest {
  caller_token: string;  // Caller's token
  ID
  callee_token: string;  // Callee's token
  ID
  caller_balance: number; // Tokens caller
  holds of callee
  requested_duration: number; // Seconds
  requested
  connection_type: 'call' | 'stream' |
  'chat';
}

interface ConnectionAccept {
  session_id: string;
  rate: number;          // Tokens per
  second
  accepted_duration: number;
}
```

Staking Operations

```
interface StakeRequest {
    token_id: string;
    amount: number;
    staker: string;
}

interface DividendClaim {
    token_id: string;
    claimant: string;
    kyc_proof: string;           // Reference to
KYC verification
    period: string;             // e.g., "2026-02"
}
```

BSV Implementation

Why BSV Only

Requirement	BSV	ETH/Others
1 token/second micropayments	✓ <0.001¢ fees	x \$0.50+ fees
Real-time settlement	✓ Instant	x Block times
Scalability	✓ Unbounded	x Gas limits
Token		

standard	BSV-20	ERC-20
----------	--------	--------

On-Chain vs Off-Chain

On-chain (BSV):

- └ Token genesis (1bn supply)
- └ Large transfers
- └ Staking/unstaking
- └ Dividend distributions
- └ KYC attestations

Off-chain (Gossip):

- └ Connection handshakes
- └ Micro-transfers during calls
- └ Real-time balance updates
- └ Periodic settlement to chain

Pricing Formula

`sqrt_decay` Model

```
price = base_price / sqrt(supply_sold + 1)
```

- **Early buyers:** Lower price (reward early supporters)
- **Later buyers:** Higher price (scarcity premium)
- **Creator benefit:** Early friends get deals, mass market pays more

Example

Base price: 500 sats
Supply sold: 0 → Price: 500 sats
Supply sold: 99 → Price: 50 sats
Supply sold: 9,999 → Price: 5 sats
Supply sold: 999,999 → Price: 0.5 sats

Security Considerations

Anti-Spam

- Connection requires tokens (economic cost)
- No tokens = no access
- Spam is expensive

Privacy

- Basic access: Pseudonymous (just addresses)
- Dividend claims: KYC required (real identity)
- User controls identity disclosure level

Sybil Resistance

- Creating fake accounts costs nothing
- But fake accounts have no social graph
- No friends = no token buyers = worthless token
- Social proof required for value

Legal Compliance & Liability

Corporate Register vs Token Ownership

The company has liability and must produce a confirmation statement each year showing an up-to-date register of members. However, Members can trade tokens that act as a claim on their shares without permission.

So while the confirmation statement may say Alice holds Title, she may have already sold her interest to Bob, who has already sold it to Charlie. The confirmation statement says Alice owns the share on the register, but that is still legally compliant, even though the reality is that Charlie holds the asset. As long as each individual pays their own taxes, they are compliant too.

Roadmap

Phase 1: Core Protocol ✓

- [x] Token model defined
- [x] Access mechanics specified
- [x] Economic flows documented

Phase 2: Client Implementation

- ☐ Video/audio call module
- ☐ Portfolio tracking
- ☐ Discovery/search
- ☐ Staking UI
- ☐ KYC integration

Phase 3: Network Launch

- ☐ Bootstrap peers
- ☐ Initial token minting
- ☐ Creator onboarding
- ☐ Market maker liquidity

Phase 4: Ecosystem

- ☐ Mobile apps
- ☐ Browser extension
- ☐ API for third-party apps
- ☐ Creator tools

Summary

\$402 creates an attention economy where:

1. **Everyone has a price** - Your token represents your time's market value
2. **Friends invest in friends** - Social relationships create liquidity
3. **Creators control access** - Your float, your

rules

4. **Speculators align with supporters** - Staking rewards belief
5. **KYC is voluntary but incentivized** - Need it for dividends
6. **BSV enables micropayments** - 1 token/second is economically viable

The network scales through genuine social investment, not viral growth hacks.

Personal Token Minting

BSV21 Standard

Personal tokens use the BSV21 fungible token standard with \$402 extensions:

```

{
  "p": "bsv-21",
  "op": "deploy",
  "tick": "$RICHARD",
  "max": "1000000000",
  "dec": "0",
  "path402": {
    "accessRate": 1,
    "protocol": "path402",
    "version": "1.0.0"
  },
  "metadata": {
    "name": "RICHARD",
    "description": "Access token for
Richard",
    "avatar": "https://...",
    "website": "https://..."
  }
}

```

Token Properties

Property	Value	Description
supply	1,000,000,000	Fixed, no further minting
decimals	0	Whole tokens only
accessRate	1-100	Tokens per second for connections
		Tokens

burning	Disabled	circulate, never destroyed
---------	----------	----------------------------------

Proof of Serve

Nodes earn rewards through actual network contribution:

Action	Description	Reward Weight
serve	Deliver content to requesters	High
relay	Forward gossip messages	Medium
index	Maintain accurate indexes	Medium
validate	Verify transactions	Low

Reward Formula:

```
node_reward = (node_serves /
total_network_serves) × daily_reward_pool
```

Why Not Proof of Work?

Proof of Work	Proof of Serve
Rewards hash	Rewards actual

computation	service
Wastes electricity	Uses real network work
Centralizes to ASICs	Scales with usage
One winner per block	Everyone who serves earns
